

AMENDMENTS TO THE SPECIFICATION

IN THE SPECIFICATION:

Please replace the paragraph beginning at page 2, line 21 with the following new paragraph:

The invention has been developed in view of the above, and it is a feature ~~an object~~ of the invention to provide an image pick-up device, which can suppress a product cost, and can easily achieve a compact structure of the product.

Please replace the paragraph beginning at page 3, line 18 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the camera may be ~~is~~ arranged on one side of the vertically opposite sides of the display device, and the optical axis of the camera is inclined toward the other side.

Please replace the paragraph beginning at page 3, line 25 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the camera may be ~~is~~ arranged on one side of the laterally opposite sides of the display device, and the optical axis of the camera is inclined toward the other side.

Please replace the paragraph beginning at page 4, line 3 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the display device is a main display portion arranged on one of opposite surfaces of the main body. The image pick-up device further includes a sub-display portion arranged on the other surface of the main body. The camera and the main display portion are arranged on the one of the opposite surfaces of the main body.

Please replace the paragraph beginning at page 4, line 12 with the following new paragraph:

Optionally ~~Preferably~~, the image pick-up device described above further includes a main display portion arranged on one of opposite surfaces of the main body. The display device is a sub-display portion arranged on the other surface of the main body, and the camera and the sub-display portion are arranged on the other surface of the main body.

Please replace the paragraph beginning at page 4, line 20 with the following new paragraph:

Optionally, ~~Preferably~~, in the image pick-up device described above, the main body has a structure of first and

second bodies foldably coupled together, and the camera and the display device are arranged on the first body.

Please replace the paragraph beginning at page 4, line 27 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the main body has a structure formed of first and second bodies foldably coupled together, the display device is arranged on the first body, and the camera is arranged on the second body.

Please replace the paragraph beginning at page 5, line 2 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the main body has a structure formed of a single body.

Please replace the paragraph beginning at page 5, line 8 with the following new paragraph:

Optionally ~~Preferably~~, the image pick-up device described above further includes an additional camera arranged on the main body, the main body has a structure formed of first and second bodies foldably coupled together, the camera is arranged on one

of the first and second bodies, and the additional camera is arranged on the other of the first and second bodies.

Please replace the paragraph beginning at page 5, line 19 with the following new paragraph:

Optionally, ~~Preferably~~, the image pick-up device described above further includes an additional camera arranged on the main body, the main body has a structure formed of first and second bodies foldably coupled together, the camera and the additional camera are arranged on one of the first and second bodies.

Please replace the paragraph beginning at page 5, line 30 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the camera and the additional camera are arranged on the different surfaces of one of the first and second bodies, respectively.

Please replace the paragraph beginning at page 5, line 33 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the additional camera has an optical axis perpendicular to the display surface of the display device, and the camera has an optical axis in a direction different from a

direction perpendicular to the display surface of the display device.

Please replace the paragraph beginning at page 6, line 5 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, the camera and the additional camera are both arranged on the same side of the one of the bodies.

Please replace the paragraph beginning at page 6, line 8 with the following new paragraph:

Optionally ~~Preferably~~, in the image pick-up device described above, one of the camera and the additional camera is arranged on the one of the vertically opposite sides of the display device, and has an optical axis inclined toward the other side of the vertically opposite sides. The other of the camera and the additional camera is arranged on the one of the laterally opposite sides of the display device, and has an optical axis inclined toward the other side of the laterally opposite sides.

Please replace the paragraph beginning at page 12, line 2 with the following new paragraph:

If angle θ_1 is smaller than 5 degrees, it ~~is impossible~~ may be difficult to achieve sufficiently the effect intended to be achieved by inclining the optical axis of camera 2 with respect to the normal to the display surface. If angle θ_1 exceeds 10 degrees, the optical axis of camera 2 intersects the normal to the display surface of main display portion 3a at a position closer to camera 2 so that possibly the operator's face may protrude from a frame of a main display portion 3a when the operator takes the operator's own picture while viewing main display portion 3a.

Please replace the paragraph beginning at page 12, line 2 with the following new paragraph:

Camera 2 is fixed to first body 1a such that the optical axis of camera 2 is inclined toward a center line C - C of camera-equipped portable device 10. More specifically, camera 2 is arranged on one (right ~~left~~ side in Fig. 3A) of the laterally opposite sides (left and right sides in Fig. 3A) of main display portion 3a, and the optical axis of camera 2 is inclined toward the other side. In the specification, center line C - C of camera-equipped portable device 10 represents a line substantially passing through a center of a short side

perpendicular to a long side direction, in which main display portion 3a is aligned to the plurality of input buttons 4.

Please replace the paragraph beginning at page 18, line 19 with the following new paragraph:

If angle θ_1 is smaller than 10 degrees, it ~~is impossible~~ may be difficult to achieve sufficiently the effect intended to be achieved by inclining the optical axis of camera 2 with respect to the normal to the display surface of main display portion 3a. If angle θ_1 exceeds 30 degrees, the optical axis of camera 2 intersects the normal to the display surface of sub-display portion 3b at a position closer to camera 2 so that possibly sub-display portion 3b may ~~not~~ be unable to display a peripheral portion of the operator's face when the operator takes the operator's own picture while viewing sub-display portion 3b.

Please replace the paragraph beginning at page 18, line 19 with the following new paragraph:

Camera 2 is fixed to first body 1a such that the optical axis of camera 2 is inclined toward center line C - C of camera-equipped portable device 10. More specifically, camera 2 is arranged on one (left ~~right~~) side in Figs. 15C) of the laterally opposite sides of sub-display portion 3b, and the optical axis of camera 2 is inclined toward the other side.

Please replace the paragraph beginning at page 21, line 8 with the following new paragraph:

Camera 2 is fixed to main body 1 such that the optical axis of camera 2 is inclined with respect to the normal to the display surface of sub-display portion 3b. The optical axis of camera 2 is inclined toward sub-display portion 3b with respect to the normal to the display surface of sub-display portion 3b. More specifically, camera 2 is arranged on one (lower ~~upper~~ side in Figs. 21A, 21B and 21C) of the vertically opposite sides (upper and lower sides in Figs. 21A, 21B and 21C) of sub-display portion 3b, and the optical axis of camera 2 is inclined toward the other side.
